

TUTORIAL NO 5

Write a C++ program to overload the swap() function for integer and floating-point values.

```
#include <iostream>
using namespace std;
```

```
class Test
{
public:
```

```
    void swap(int a, int b)
    {
        int temp;
        temp = a;
        a = b;
        b = temp;

        cout << "Integer after swapping: " << a << " " << b << endl;
    }
```

```
    void swap(float a, float b)
    {
        float temp;
        temp = a;
        a = b;
        b = temp;

        cout << "Float after swapping: " << a << " " << b << endl;
    }
};
```

```
int main()
{
    Test s;
```

```
s.swap(10, 20);  
s.swap(10.5f, 20.5f);  
  
return 0;  
}
```

OUTPUT:

```
Integer after swapping: 20 10  
Float after swapping: 20.5 10.5
```
